

Burndown Chart Sprint 2

Description

- The chart is the burndown for our sprint 2
- This burndown chart measures our progress over time during the sprint
- During our initial meeting for this sprint, the group measured each user story by story points in terms of the difficulty in developing the corresponding feature.
- Hence, in the above chart progress is measured by the number of user points remaining vs completed over time
- So day 0 of the sprint starts with the total number of story points to be completed. From the chart, it seems like everything was done on the last day, but this is far from the truth as we made progress on each user story incrementally throughout the sprint. But, we finished all the stories just as the sprint was about to finish which ends up giving a lopsided view of our progress that may not be 100% accurate.
- The number of days worked represents the days we were required to work. Reading week days were considered as non-work days by the group even if work may have been done behind the scenes.

Velocity:

- For this sprint, we started with 39 points, and were able to complete 34 of them, remaining with just 5 points at the end.
- Last sprint, we started with just 15 story points, and finished 10 of them.
- Comparing last sprint to this sprint, we started with a lot more story points this sprint. But during our initial voting phase for the story points, the group felt we may have underestimated the point assignment in our last sprint as some of the tasks were more difficult than we anticipated. This experience made us reevaluate our point system and be less conservative in our point assignment for stories.
- Overall, this sprint we finished 87% of the story points compared to 67% last sprint.
